## MIPS R10000

- Shipping in 1996
- Designed to overcome performance limits
  - » Memory bandwidth and latency
  - » Compiler scheduling not effective on integer applications
- Representative modern microprocessor design
  - » multiple instruction issue
  - » register renaming
  - » out-of-order execution
  - » speculative execution
  - » non-blocking caches
  - » precise exceptions
- Detailed look at architecture
- Performance summary
- K. Yeager, "The MIPS R10000 superscalar microprocessor," IEEE Micro, vol. 16, pp. 28–40, 1996.

4

## Instruction Fetch/Decode

---

- Fetch four instructions per cycle
  - » any word alignment within 16 word cache line
- Decode up to four instructions per cycle
  - » requires four separate decoders
- Instructions not decoded are placed in 8-word instruction buffer
  - » caused by structural hazards or special instructions

5

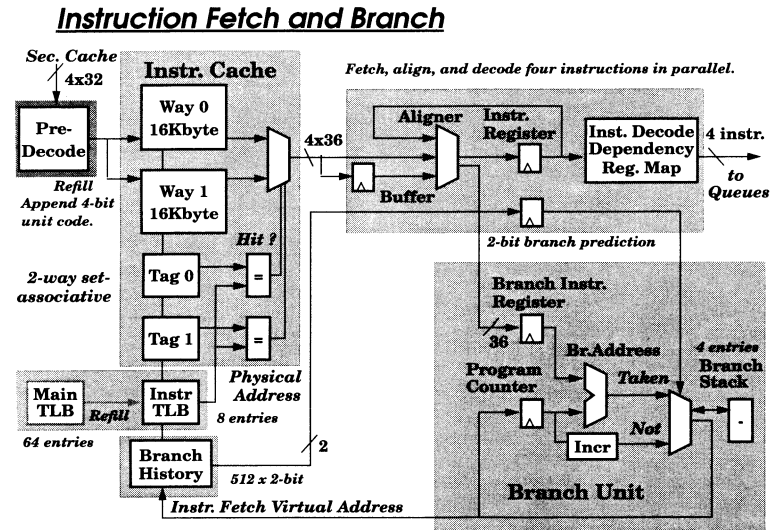

## Branch Unit

---

- Branches occur frequently
- 2-bit 512 entry BHT
- 1 branch delay slot for taken branches
- Delayed branches add difficulty
- Four entry branch stack
  - » alternate branch address
  - » copy of integer and FP register map tables
- Mispredicted branches
  - » immediately restore state (Int & FP tables) and fetch from alternate branch address
  - » 4 bit branch mask associated with each instruction used to abort instructions

6

# Instruction Fetch and Branch

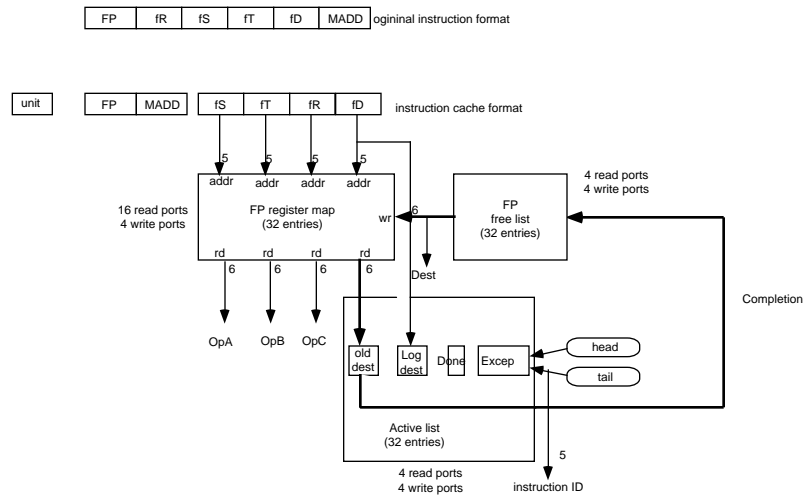

7

## Register Renaming

- Convert 5-bit logical register numbers to 6-bit physical register numbers
  - » Eliminates WAR and WAW hazards
  - » Support for speculation and precise interrupts
- Register map tables
  - » Integer : 33 x 6 bit RAM
  - » FP : 32 x 6 bit RAM
- Free lists
  - » lists of currently unassigned physical registers
  - » 32 entry FIFOs
- Active list
  - » All instructions "in flight" in the machine kept in 32 entry FIFO
  - » provides unique 5-bit ID for each instruction
  - » operates like a reorder buffer
  - » logical destination number
  - » old physical register number
  - » done bit

8

# Register Renaming

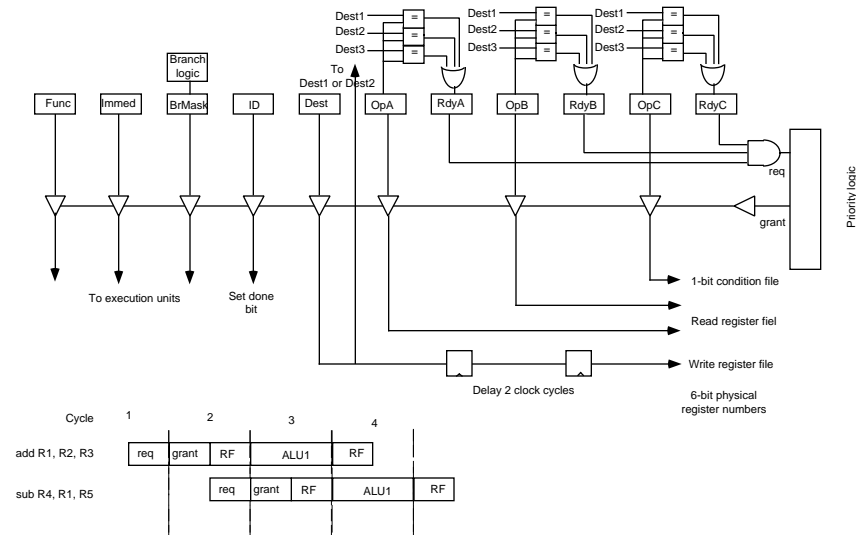

9

# Queues

- Integer, Address, FP queues
- Design limits clock frequency
- Entries allocated at decode
- Integer queue
  - » 16 entries
  - » no order
  - » ten 16 bit comparators per entry for RAW hazards
- FP queue
  - » similar to integer queue
- Address queue
  - » similar to integer queue
  - » FIFO order

10

# Integer Queue

11

# Register Files

- Integer register files
  - » 64 registers
  - » 7 read ports
  - » 3 write ports
  - » separate 64 bit condition file
- FP register file
  - » 64 registers
  - » 5 read ports
  - » 3 write ports

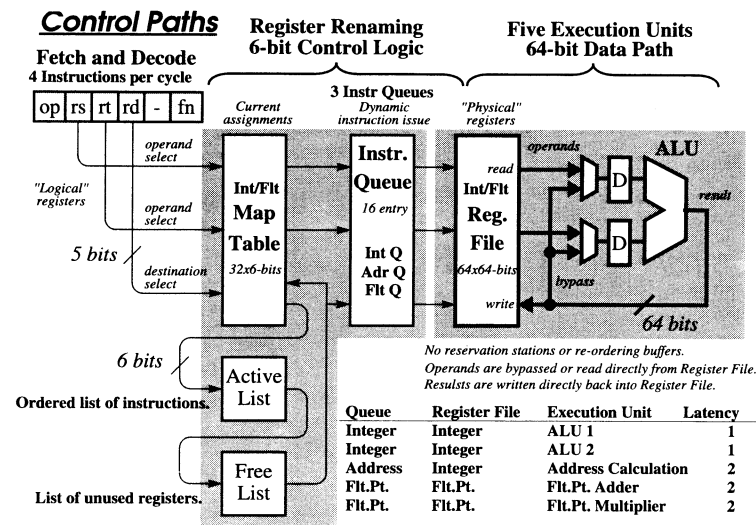

12

## Execution Units

Unit	Latency (cycles)	Repeat rate (cycles)	Instruction
Either ALU	1	1	add, sub, logical, trap
ALU1	1	1	branch
ALU2	10	10	64-bit multiply
ALU2	67	67	64-bit divide
Load/store	2	1	load integer
Add	2	1	add, sub, compare
Multiply	2	1	DP multiply
Divide	19	21	DP divide
Load/store	3	1	load FP value

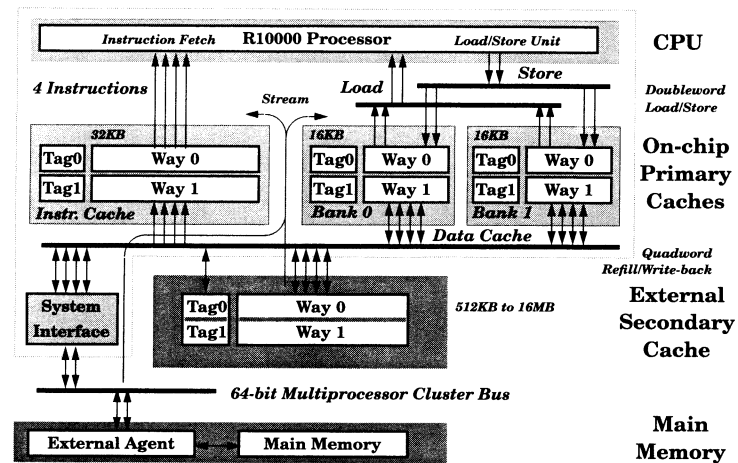

13

## Instruction Execution Review

14

# Memory Hierarchy

15

# Memory Hierarchy

- Instruction cache
  - » 32 KB, 2-way SA, 128 B line size
- Load/store Unit
  - » address calculation
  - » memory address translation (TLB)
    - 64 entries FA
    - 2 pages per entry
- Data cache
  - » 32 KB, 2-way SA, 64 B line size, write-back
  - » 2-way interleaved for bandwidth to support loads, stores, cache refills
  - » nonblocking with four outstanding requests
- Secondary cache
  - » 128 b wide interface
  - » 512KB–16 MB
  - » pseudo 2-way SA using 8 Kb MRU table

16

# Implementation

- 0.35 micron process
- 16.6 × 17.9 mm chip
- 298 mm<sup>2</sup>
- 6.8 million transistors
  - » 4.4 million cache
  - » 2.4 million logic
- Full-custom design for datapaths and control logic
- Semi-custom design for less critical control logic

17

## Nonblocking Data Cache Performance

18

## R10K Performance

13 SPEC95int and 22 SPEC95fp @ 250 MHz
